Week 7 Live Summary

Async makes a function return a promise while await makes a function wait for a promise. You can set up your promise to give a value result if it outputs correctly, or if an error is found you can have the error message output to the console. Couldn't get full sound on the portion discussing the promise example that was done just bits and pieces, but from the looks of it, it seemed to just showcase setting up a promise with the resolve and reject parameters that would hopefully print out the desired outcome in the console if correct or otherwise.

A few assignments from week 6 were reviewed for problems we were having getting data to appear or the page breaking for strange reasons.
