Week 5 Live Summary

Modules are a library of all our different functions and scripts of our code. A class is an item we can call back to in our javascript code. We can assign the class any information we'd like. For the example we created a class called "vehicle" and assigned "wheels" and "topSpeed" to the constructor. We then defined wheels and topSpeed using "this.nameHere". After, a constant tricycle was created to input two numbers to represent the constructors, 3 and 20, and then consoled each contractor to see the assigned values.

We reviewed the setup for the practice assignment for the week. React is a javascript library for building user interfaces specifically for single-page applications. We can change data without reloading the page.
